##Neurona M-P

Implementando la Neurona M-P

- MPNeuron

[5]:
```
import numpy as np
class MPNeuron:
    def __init__(self):
        self.threshold = None
    def model(self, x):
        # input: [1, 0, 1, 0] [x1, x2, .., xn]
        z = sum(x)
        return (z >= self.threshold)
    def predict(self, X):
        # input: [[1, 0, 1, 0], [1, 0, 1, 1]]
        Y = []
        for x in X:
            result = self.model(x)
            Y.append(result)
        return np.array(Y)
```

[6]:
```
# Instanciamos la neurona
mp_neuron = MPNeuron()
```

[7]:
```
 # Establecemos un threshold
mp_neuron.threshold = 4
```

[8]:
```
# Evaluamos diferentes casos de uso
mp_neuron.predict([[1, 0, 0, 0], [1, 1, 1, 1], [1, 1, 1, 0]])
```

[8]:
```
array([False,  True, False])
```
